Dear Sir:

This is a petition under MPEP 708.02 to make the instant application special by reason of infringement of the invention thereof.

The petition fee under 37 CFR 1.17(i) should be charged to PTO Deposit Account No. 502557. Applicant is small entity.

Also enclosed is an Opinion of Patentability and an Opinion of Infringement which, collectively, satisfy the requirements of MPEP 708.02 (II).

Respectfully submitted,
LOUIS I. MEMRAN

File No. 1351.01

IN THE UNITED STATES PATENT AND TRADEMARK OFFICE

APPLICANT: Memran, Louis I. EXAMINER: Trost
SERIAL NO: 10/002, 382 ART UNIT: 2683
For: System for utilizing vacuum tubes in computer audio-circuitry
Filed: 10/20/01

OPINION OF PATENTABILITY

U.S. Patent and Trademark Office
Asst. Commissioner for Petitions
Box DAC
Washington, DC 20231

Dear Sir:

Currently, solid state devices such as transistors and the like are used in IC boards for the amplification of audio signals in computer audio circuitry. Transistors are compact, cheap and reliable components. However, transistors are unable to produce an audio sound which is particularly pleasant to the human ear. In low cost digital-to-analog converters, the sound which the transistors produce is often harsh. This technology therefore does not enhance the sound quality of low cost speakers which are employed with most personal computers today. Conversely, vacuum tubes, where used at all in contemporary electronics, are employed in expensive audio systems which require transformers and ancillary vacuum tubes for their operation.

This invention provides a system and means of integrating vacuum tubes into the motherboard of a personal computer to thereby furnish, to the otherwise pedestrian speakers thereof, high quality audio characteristics.

I have caused to be effected a careful and thorough search of the art. As a result, the only art now known to the Applicant in which vacuum tubes are employed in analog-

File No. 1351.01

to digital or digital-to-analog technology relate to the areas of audio processing; sound mixing, often as a part of a loudspeaker control circuit; and electric instruments.

This technology is reflected in the following:

U.S. Patent No. 5, 721, 784 (1990) to Bernardo, entitled Asymmetrical Driver for Asymmetrical Loudspeakers.

U.S. Patent No. 5,789,689 (1998) to Doidic, entitled Tube Modeling Programmable Digital Guitar Amplification System;

U.S. Patent No. 802, 182 (1998) to Pritchard, entitled Audio Process Distortion; and

U.S. Patent No. 6, 350, 943 (2002) to Suruga et. al., entitled Electric Instrument Amplifier.

A copy of the Abstract of each of the above is enclosed herewith. As may be noted therefrom, traditional vacuum tubes, where combined in some fashion with contemporary digital circuitry, relate almost exclusively to audio amplifiers and amplifiers for electric instruments, such as electric guitars. Accordingly the art does not teach a practical means of integrating a vacuum tube into a motherboard of a CPU of a personal computer having, as an effect thereof, the enhancement of the audio quality of otherwise conventional speakers associated with the personal computer.

I therefore am of the opinion that the invention, as claimed, is clearly allowable over all effective art of record.

[57] **ABSTRACT**

An audio output system, having loudspeakers with an asymmetrical output in response to symmetrical modulated input signals, is provided with a unidirectional limiting circuit for proportionally reducing input signals of a polarity to drive the loudspeaker in the direction of its greatest response. In its basic form, the limiting circuit is a voltage limiting circuit, preferably a voltage divider, which includes a rectifier device. When the driving signal is of a polarity to produce a greater response from the loudspeaker, the rectifier device conducts and the magnitude of the signal voltage is reduced, resulting in substantially greater uniformity of output response of the loudspeaker in both directions. When the limiting circuit is placed on the input side of the power amplifier, the rectifier device advantageously is a vacuum tube connected as a diode. When located in the output stages of the power amplifier, where higher signal voltages are available, solid state rectifier devices may be employed. Multiple asymmetrical loudspeakers may be controlled using a single limiting circuit, provided all such loudspeakers are connected so that their greater response results when the signal thereto is of the same polarity.

[57] **ABSTRACT**

An electric guitar amplifier which utilizes a digital signal processor to produce vacuum-tube-like distortion without certain unwanted audio artifacts created by previous digital realizations of nonlinear, high-gain functions. By virtue of a microprocessor-controlled digital signal processor embodiment, the invention gives the user programmable control over parameters normally associated with state of the art guitar amplifiers (e.g. tone controls, reverb controls, tremolo controls, etc.), as well as other musically useful parameters which are not normally included among the controls of a guitar amplifier (e.g. selection of preamp type, autovolume, reverberation type, autowah, etc.).

Attorney, Agent, or Firm—Barnes & Thornburg

[57] ABSTRACT

The audio process is a signal path having a plurality of filters connected or including distortion means. The prime example of this phenomenon surrounds inductances such as found in magnetic tape recorders, spring reverberators, and transformers. The inductors require a pre-emphasis filter to produce a constant current. Secondly there are the complementary filters associated with the average spectrum of audio which are used to maximize the signal to noise ratio. Ideally the net response of the filters is flat, however, roll-offs at the audio extremes are quite common.

The audio process distortion emulates the distortion of the active devices between the filters such as vacuum tube and magnet non-linearities. Since the distortion devices follow filters, the spectra of distortion is different than the frequency response.

(57) **ABSTRACT**

An electric instrument amplifier emulates an audio characteristics of a traditional vacuum-tube type amplifier. The electric instrument amplifier is formed in a single housing for amplifying an audio signal from an electric instrument. The electric instrument amplifier includes an A/D (analog-to-digital) converter for converting a first analog signal from the electric instrument to a digital signal, a digital signal processing circuit for processing the digital signal to add an intended effect to the digital signal, a D/A (digital-to-analog) converter for converting the digital signal processed by the digital signal processing circuit to a second analog signal, a tube amplifier having at least one vacuum-tube for amplifying the second analog signal, and a virtual power circuit formed with semiconductor devices for amplifying or attenuating an audio signal produced by the tube amplifier.

OPINION OF INFRINGEMENT

U.S. Patent and Trademark Office
Asst. Commissioner for Petitions
Box DAC
Washington, DC 20231

Dear Sir:

I, the Applicant's attorney of record, have reviewed the attached articles of AOPEN.COM, Inc. of Taiwan, Republic of China concerning an AX4B-533 vacuum tube and its related motherboard. In or about June, 2002, AOPEN introduced into the United States a chipset which integrated the AX4B-533 tube into a CPU motherboard utilizing an Intel 845E chip. This incorporation of a vacuum tube into such a chipset for was for the purposes of enhancing the audio quality of speakers associated with a personal computer and, as such, falls within the scope of Applicant's Claim I which reads as follows:

"1. A tube card for use with computer audio circuitry comprising:
at least one vacuum tube, each said vacuum tube having an input and an output;
a DC-to-DC voltage converter supplying high voltage to said vacuum tube; and
an analog output signal from a sound input into said at least one vacuum tube,
said output of said at least one vacuum tube connected to an external device."

Further, independent Claim 5 of the present application reads as follows:

File No. 1351.01

"5. A combination tube card for use with computer audio circuitry, comprising:
at least one vacuum tube, each said vacuum tube having an input and an output;
a DC-to-DC converter supplying high voltage to said vacuum tube; and
a sound chip having an analog output, said analog output connected to an input of
at least one vacuum tube, said output of said at least one vacuum tube connected
to an external device."

The above claims thereby cover the use of the Applicant's technology with
reference to both sound cards and sound chips, and also relate to the use thereof within a
motherboard of a computer as, for example, is reflected in Claim 6 which reads as
follows:

"6. The combination of a tube card for use with computer audio circuitry of claim
5 wherein:

said sound chip having a digital input/output, said digital input/output connected
to a motherboard of a computer."

In view of the above, the motherboard offered by AOPEN.COM since June, 2002
falls within the scope of one or more of the claims of the instant application.

Upon information belief, AOPEN.COM not only offers their products on the
Internet but, as well, sells through U.S. distributors and has been doing so for several
months under the trademark COMPUTUBE.

The undersigned does not know of any patent held by AOPEN.COM or its
distributors. Further, given the publication of the instant Application on or about May 2,
2002, it is unlikely that an application for patent directed to the COMPUTUBE could
have been filed unless, unknown by the undersigned, the same had already been filed by

File No. 1351.01

such date. In any event, such filing would, in all likelihood, have been well subsequent to the Applicant's domestic priority under Serial No. 60/245, 285, of November 1, 2000.

Respectfully submitted
LOUIS I. MEMRAN

Melvin K. Silverman

AOpen manufactures computer components as part of the successful \$7 billion Acer group has more than 22 years of experience in the PC industry and over 700 patents in PC technology. Like AOpen, computer components function as part of a whole. To be successful each component must work flawlessly within a broad range of other computer products. Understanding this, AOpen dedicates its engineering expertise to the production of components of quality, durability, and the utmost flexibility.

From bare systems, motherboards, CD-ROM/CD-RW/DVD drives, and monitors to multimedia add-on cards, and communication solutions, AOpen products offer the ultimate in performance and compatibility, unmatched by any other PC manufacturer in the world. Above all, to ensure the highest standard of quality, every AOpen product is manufactured and tested in strict ISO 14001 certified facilities, complying with the world's most rigid safety standards.

The "Open" of AOpen reveals a spirit that derives directly from the union of customers and products. The realization of this has been our drive towards Open Architecture products, Open Mind innovation, and our Open Business partnership with customers and distributor

AOpen releases mainboard with vacuum tubes

By Ana Leticia Sigvartsen
[InfoSatellite.com](#)
June 05, 2002

AOpen released yesterday an innovative (and even a little weird at first sight) product. The company is now promoting the world's first vacuum tube motherboard, called AX4B-533Tube. Even though the attention in this solution is all turned to the tubes, the chipset is still important, and, in this case, it's the Intel 845E.

AOpen explained that the idea didn't come from nowhere and seems to have solid foundations. The AX4B-533Tube, said the company, "incorporates the novel, modern-day adoption of an idea that was spawned by the invention of the electric light bulb by Thomas A. Edison back in 1879 - the vacuum tube."

The reason why AOpen decided to put the tubes in the new solution is allegedly to improve audio capabilities considerably. The company is turning its focus to "passionate audiophiles and extreme gamers," who the company expects are interested in having the best in audio technology. The solution can be complemented by systems and the latest CD and DVD playback devices.

A little more about how the idea was born: "We were all together late one night, kicking around lots of crazy ideas when I proposed it would be really cool if we could combine the warmth and depth - tonal realism, if you will - of the sound produced by

an audio tube, with one of our state-of-the-art motherboards" said AI Peng, product manager at AOpen America. "Laughter turned into raves a few months later when we did our first lab demo of our unique hybrid creation. The reproduced sound was absolutely amazing. It left everyone stunned. What we realized at that moment was how the limitations of typical audio output from a PC as we knew it, had come to an end - and what we were pioneering was a way to literally combine the best of two audio worlds - old and new."

AOpen defends the tubes as the best solution in terms of tonality and claims that the tube output stage of the AX4B-533Tube couples the two front digital stereo output channels with tube output, resulting in outstanding quality of sound.

Putting aside the tubes, let's get to the regular specifications: the AX4B-533Tube comes with the i845E chipset design and features DDR SDRAM

memory channels delivering 2.1 GB/s of memory bandwidth to the processor, being made for the Intel Pentium 4 processor with 533Mhz FSB. It comes with a 4X AGP slots, supports 4 ports of USB 2.0 and Ultra ATA/100 interface.

The AX4B-533Tube has an estimated street price of \$215 and fully supports ACPI 1.0 and APM 1.2 specs. It comes bundled with Norton Anti-Virus 2002 software.

Tube: AX4B-533

Edison's Revolutionary Invention Finds New Life in 21st Century

AX4B-533 Tube -- The new Motherboard incorporates the novel, modern-day adoption of an idea that was spawned by the invention of the electric light bulb by Thomas A. Edison back in 1879 - the vacuum tube.

In taking this bold step towards audio perfection, AOpen's hybrid AX4B-533 Tube unquestionably is targeted to a very exclusive niche market - passionate audiophiles and extreme gamers who are interested in building their own ultimate entertaining PCs. The motherboard is also certain to appeal to retailers that desire to cater to these two eccentric groups with custom-built PCs, delivered with matching speaker systems and the latest CD and DVD playback devices.

If you are interested in AX4B-533 Tube, please fill the application form to leave your information. We will provide you the latest news about Tube as soon as possible. To stop all e-mail tube news from AOpen, click this "[Unsubscribe](#)" link to unsubscribe it.
